Firebase Realtime storage:

Workflow of the application:

Tech stack:

Explanation:

TravelMate is a Flutter-based travel planning application that helps users plan, organize, and manage their trips in one place.

Users can create trips, build day-wise itineraries, save locations with Google Maps, manage bookings, maintain packing and to-do checklists, write travel notes, and track expenses. The app also supports offline storage, allowing users to access and manage their trip information without an internet connection, with data synchronized to Firebase Realtime Database when they are online.

Basic widget tree for my application:

Key Features of TravelMate

- **Day-Wise Itinerary** – Organize activities and plans for each day of a trip.
- **Visual Itinerary** – View the complete trip plan in an easy-to-understand visual format.
- **Customised Itinerary** – Create and modify itineraries according to individual travel needs.
- **Collaborative Trip Editing** – Allow trip members to contribute and update trip information.
- **Trip Members** – Manage people participating in a trip.
- **Booking Master Folder** – Keep booking confirmations and travel documents organized in one place.
- **Offline Storage** – Access and manage important trip information even without an internet connection.
- **Automatic Synchronization** – Synchronize locally stored data with **Firestore Realtime Database** when the device is online.
- **Google Maps Integration** – Save locations and open them directly in Google Maps.
- **Road Trip Planner** – Plan routes and organize stops for road journeys.
- **Packing Checklist** – Create and manage a checklist of items to pack.
- **Travel To-Do List** – Track tasks that need to be completed before or during a trip.
- **Travel Notes** – Store important notes, reminders, and travel information.
- **Expense Tracking** – Record and monitor basic trip-related expenses.
- **Trip Dashboard** – Provides a central overview and quick access to all trip features.
- **Local + Cloud Data Management** – Combines local storage with cloud storage to provide both **offline accessibility and synchronized data**.
- **Responsive User Interface** – Designed to work across different screen sizes with a clean and interactive interface.
